Canadian Data Report of Fisheries and Aquatic Sciences No. 435

Canadian Data Report of Fisheries and Aquatic Sciences

These reports provide a medium for filing and archiving data compilations where little or no analysis is included. Such compilations commonly will have been prepared in support of other journal publications or reports. The subject matter of Data Reports reflects the broad interests and policies of the Department of Fisheries and Oceans, namely, fisheries management, technology and development, ocean sciences, and aquatic environments relevant to Canada.

Numbers 1-25 in this series were issued as Fisheries and Marine Service Data Records. Numbers 26-160 were issued as Department of Fisheries and the Environment, Fisheries and Marine Service Data Reports. The current series name was changed with report number 161.

The correct citation appears above the abstract of each report.

Rapport statistique canadien des sciences halieutiques et aquatiques

Ces rapports servent de base à la compilation des données de classement et d'archives pour lesquelles il y a peu ou point d'analyse. Cette compilation aura d'ordinaire été préparée pour appuyer d'autres publications ou rapports. Les sujets des Rapports statistiques reflètent la vaste gamme des intérêts et politiques du Ministère des Pêches et des Océans, notamment gestion des pêches, techniques et développement, sciences océaniques et environnements aquatiques, au Canada.

Les numéros 1 à 25 de cette série ont été publiés à titre de Records statistiques, Service des pêches et de la mer. Les numéros 26-160 ont été publiés à titre de Rapports statistiques du Service des pêches et de la mer, Ministère des Pêches et de l'Environnement. Le nom de la série a été modifié à partir du numéro 161.

Le titre exact paraît au haut du résumé de chaque rapport.

ABSTRACT

Andersen, B. C. 1983. Fish populations of Carnation Creek and other Barkley Sound streams 1981-1982. Can. Data Rep. Fish. Aquat. Sci. 435: iii + 63 p.

A summary of fish population data, collected as part of the Carnation Creek Experimental Watershed Project, is presented. The time period covered is January 1981 to December 1982.

Key words: Watershed study, coho, chum, steelhead, cutthroat, sculpin, logging, Carnation Creek

RÉSUMÉ

Andersen, B. C. 1983. Fish populations of Carnation Creek and other Barkley Sound streams 1981-1982. Can. Data Rep. Fish. Aquat. Sci. 435: iii + 63 p.

On présente un résumé des données sur les populations de poisson, recueillies dans le cadre d'un project d'étude expérimentale du bassin hydrographique du ruisseau Carnation, de janvier 1981 à décembre 1982.

Mots-clés: étude du bassin hydrographique, saumon coho, saumon kéta, truite arc-en-ciel anadrome, truite fardée, chabot, abattage du bois, ruisseau Carnation

INTRODUCTION

The Carnation Creek Experimental Watershed Project started in 1970 with the initiation of pre-logging studies (Narver and Chamberlain 1967). Road construction started in January 1975 and logging started in the fall of 1975. Most of the road construction was completed by the end of the 1977-78 winter. Logging was completed in June 1981 (Fig. 2).

The basic rational for the study, the study sites, adjacent study streams (Fig. 1), and methods used in fish studies have all been described in Andersen (1983). All comparisons in this report have reference to Andersen (1983). This report covers the period January 1981 to December 1982.

RESULTS

ADULT STUDIES

Coho

In 1981 and 1982 the return of jack coho was at pre 1978 levels, large males were within the range of previous years and in 1981 females had the lowest return recorded in this study (44% fewer than the 12 yr mean).

	Return		
Year	Jack (.+)	Large male (.1+)	Female
12 yr. mean (1971-1982)	84.6	89.3	76.9
1981	61	76	43
1982	61	103	71

The age compositions of adult coho are given in Table 1.

In both 1981 and 1982 the mean fork lengths of jack coho (.+) and females are within the range of previous years and near the 12 year average of yearly means. The large males (.1+) had fork lengths at the lower end of the range and 1982 large males had the lowest mean fork length of all years studied. The 12 year average of yearly means was 33.7 cm for jacks, 59.0 cm for large males and 65.2 cm for females. Length distributions and mean length by age and sex are given in Table 3.

Time of entry into the stream continues to be strongly dependent on stream discharge levels (Table 2). In both years (1981 and 1982) 85% of the adult coho run had passed the counting fence by mid November.

Chum

The estimates of chum salmon spawning escapement (above and below fence in Carnation Creek were:

Year	Escapement
13 year mean (1970-1982)	2014 (range 450-4168)
1981	2300
1982	1600

Weekly counts of chum salmon, by sex, passing Carnation Creek fence in 1981 and 1982 are in Table 4.

Length distributions, by sex are given in Table 5. The mean fork lengths were:

Year	Male (cm)	Female (cm)
13 yr average of yearly means	73.0	70.5
1981	74.7	72.2
1982	71.9	69.2

The dominant age group of chum adults continued to be three winters in the ocean as determined by otoliths (Table 6).

Steelhead and cutthroat

No steelhead were caught in 1981 or 1982. One cutthroat was caugnt April 12, 1981 going downstream (length 61 cm, age 3.3).

The fact that no steelhead and only one cutthroat were caught is not an indication of returns. When the fence is fishing for juveniles from mid March to August high stream discharge can flood out the fence and allow adult fish to pass unobserved. Also the fence was not operated from Jan. 24 - Feb. 22, 1982.

Other salmon

In both 1981 and 1982 a few sockeye spawners were observed below the counting fence. In 1982, for the first time, a few chinook adults were observed in intertidal area below the fence. No pink spawners were seen in 1981 or 1982.

JUVENILE STUDIES

The basic data on length, length-weight, condition factor, populations, densities, and biomass for juvenile fish are in the appendixes.

Downstream migrants

Outmigrations of juvenile salmonids in relation to date, water temperature, and maximum stream discharge are presented in Figs. 3 and 4. Total counts for 1981 and 1982 are summarized in Table 7.

Coho

A summary of juvenile coho outmigration data by age:

Year	Fry run	I+ <60 mm run	I+ ≥ 60 mm run	I+ ≥ 60 mm Mean length (mm)	II+ Run	II+ Mean length (mm)	Total I+,II+, run ≥60 mm
12 yr mean 1971-82	17,520[a]	82	2129	79.6[b]	878	99.8[b]	3007
1981	11,303	49	3719	82.4	396	104.1	4115
1982	4,108	1	2847	86.6	622	100.1	3469

[a] 11 year mean (1972-82)

[b] average of the yearly means

The numbers of age I+ coho smolts in both 1981 and 1982 continue a trend that started in 1978 of being much above the mean. Age II+ smolts numbers have declined dramatically in the past 2 years, with 1981 numbers being 55% below the 12 year mean and 1982 numbers being 29% below the mean.

In 1981 and 1982 the coho smolts migrated primarily in late April and early May. The 50% point of the run (Table 8) occurred very close to the 12 year mean date of May 6.

The weekly mean lengths of coho smolts (Fig. 5) were similar to those observed in previous years for age II+, but age I+ continued a trend to larger smolts that started in 1978. The 1982 age I+ smolts were the largest for all years studied.

In 1981 and 1982 coho fry numbers were much less than the 12 year mean. The 1982 run was smallest of all years studied and is probably a reflection of a very low number of female coho spawners the previous fall. In 1981 the 50% point of the coho fry run (Table 8) was 17 days earlier than the previous earliest date and 35 days earlier than the 12 year mean date. This trend to earlier fry migration started in 1977. Mean lengths of coho fry in the downstream run are summarized in Table 9.

Chum salmon

Chum fry outmigrations from above the fence:

11 yr mean 1972-1982	45532
1981	71640
1982	2904

In 1981 the 50% point of the chum fry run (Table 8) occurred 30 days earlier than the 12 year mean date. Mean lengths of chum fry in the downstream run are summarized in Table 9.

Steelhead and cutthroat

	Steelhead				Cutthroat		
	<100 mm	≥100 mm			<100 mm	≥100 mm	
Year	Run	Run	Mean length	50% point of run	Run	Run	Mean length
11 year mean	90.2	67.4	141.2[a]	May 16	12.0	44.9	136.0[a]
1981	21	14	136.7	Apr 23	19	38	123.5
1982	17	36	134.6	May 10	8	6	152.3

[a]Average of yearly mean lengths.

The 50% point of steelhead smolt outmigration shows a trend, starting in 1977, of being much earlier than in previous years. In 1981 the 50% point is 3 weeks earlier than the 11 year mean date. The numbers of both steelhead and cutthroat smolts continue to show the large decline that started in 1978. Mean lengths of both cutthroat and steelhead (≤100 mm) are within the range of previous years.

The age compositions and mean lengths of juvenile steelnead and cutthroat in the downstream migrations are given in Table 10.

Resident fish

The late summer population estimates and fish densities for the lowest 3070 m of Carnation Creek are given in Tables 11 and 12.

Late summer population estimates for lower Carnation Creek:

	Coho		Rainbow			Cottus aleuticus
	0	I	0	I	II	All
13 year mean (1970-82)	11,499	1,128	1,908	292	104	(2519)[a]
1981	5,909	743	1,774	116	8	2187
1982	7,337	220	1,063	346	47	1811

[a]1972-1982.

The population estimates for age 0 coho are much lower than the 13 year mean for both 1981 and 1982 and well below the range of previous years. The 1981 estimate of age I coho is within the range of previous years but the estimate for 1982 is less than a third of the previous low and 19.5% of the 13 year mean. The numbers of rainbow trout recovered somewhat from the decline of the previous 4 years. The sculpin populations in 1981 and 1982 were within the range of previous years.

The late summer fish densities by study section for lower Carnation Creek (Table 12) snow that densities of age 0 coho were lowest of all years studied for both 1981 and 1982 in section II, near the mean for sections III and IV and among lowest for sections V, VI and VIII. For age I coho in sections II to VI densities were among the lowest for 1981 and by far the lowest in 1982; section VIII densities were near the 13 year mean.

Densities of sculpins were within the range of previous years in all study sections.

In late July of 1982 the usual population estimates were done. In addition six extra study sections were done in order to check the validity of extrapolating the fish populations of approximately 13% of lower Carnation Creek to all 3070 meters of lower Carnation Creek. The addition of the extra sections resulted in 25% of lower Carnation Creek being sampled. Using data from the usual 6 study sections the extrapolated population estimates were 1.9% nigher for age 0 coho and 21% nigher for age I coho than when data from all 12 sections were used.

Late summer density of resident fish in 1981 and 1982 for Carnation Creek and other streams are summarized in Table 13. In both years the densities of age 0 and I cutthroat in Upper Carnation Creek were higher than any previous year. Densities of coho fry in Useless Creek were very low in both years and in 1981, lowest of all years studied. Useless Creek cutthroat fry densities were lowest in 1981 and highest in 1982 of all years studied. Cutthroat fry densities in Ritherdon Creek have recovered to pre-1976 levels.

Late summer biomasses (g/m^2) of resident fish in 1981 and 1982 are summarized for all streams in Table 14.

A summary of late summer mean lengths (mm) for all streams and all salmonid species is given in Table 15. In both 1981 and 1982, lower Carnation Creek age 0 and I coho were larger than in any previous year.

ACKNOWLEDGMENTS

The writer wishes to acknowledge the help of the many people who participated in the field work over the last 2 years. All computer work was done by P. Neaves.

Cottus asper		213[a]	527[b]
Cottus aleuticus		34[a]	60[b]
Sampling period		Mar 5-Aug 4	Mar 5-Aug 15

Note: in 1981 895 pink fry were caugnt at tne fence.

[a]Counts ends July 7

[b]Counts ends July 8

Table 8. Dates when 25, 50 and 75% of the downstream migration of coho, chum, and steelhead occurred in Carnation Creek 1981, 1982.

Species	Accum %	1981	1982
Coho smolts	25	April 24	April 29
	50	May 5	May 6
	75	May 17	May 14
Steelhead (≥100 mm)	25	March 31	April 28
	50	April 23	May 10
	75	May 17	May 18
Coho fry	25	March 22	March 31
	50	March 24	April 11
	75	March 28	April 13
Chum fry	25	March 15	April 15
	50	March 21	April 16
	75	March 23	April 18

Table 9. Mean length, range and standard deviation of coho and chum fry at ~1 week intervals in the 1981, 1982. Carnation Creek outmigrations.
